

06 — The Window Closes

Why three to five years represents the window of opportunity, and what transpires should Europe miss its mark.

What this instalment covers

- Chinese presence in Giant Juncao exports: active promotion campaigns since 2010 in Papua New Guinea, Fiji, the Central African Republic, Zimbabwe, Rwanda, and Madagascar — more than twelve thousand farms in sixteen provinces across eight countries.
- What a geographical head start entails: local breeding stations, local product lines, local knowledge bases, local trade networks — achievements that cannot be overtaken by European capital injection alone.
- The parallel with solar panels: Europe was the inventor, China became the producer, and Europe became the consumer. Without swift intervention, this pattern shall repeat itself for BiCRS and biofuel derived from Juncao.
- The parallel with semiconductors: ASML demonstrated what European industry can still deliver when a single company is supported by a single government for thirty years. However, one company does not constitute a continent.
- The Russian chain reaction: as soon as Russia loses its fossil energy, its economic model collapses. The question remains who will provide the replacement energy. He who possesses the Juncao axis, possesses the answers.
- The American alternative: Trump's cabinet of lawyers is not building BiCRS facilities. That is an invitation that is not forthcoming.

This instalment is currently being further developed with a timeline graph of Chinese Juncao exports since 2010 and the three geopolitical scenarios in the event of missing the window.
